Skills

Security Domains: Threat Modeling, Vulnerability Management, Incident Response, Risk Mitigation, System Hardening

Compliance & Governance: NIST CSF, Security Controls, Data Privacy Standards (GDPR, SOC2), Zero trust Architecture

Tools & Technologies: SIEM (Chronicle, Splunk), Linux CLI, Virtualization (VMware, VirtualBox), Wireshark, Microsoft Entra ID (Azure AD), Identity & Access Management (IAM).

Languages & Scripting: Python, SQL (Relational Databases), Bash Shell Scripting

Projects

Automated Password Cracker

[GitHub.com/passwordcracker](https://github.com/pranshu030803/passwordcracker)

- Built a Python command-line tool that automates dictionary attacks to test and audit the strength of password-protected ZIP archives
- Used Python's native zipfile module along with smart error handling to catch decryption crashes, allowing the script to smoothly cycle through a wordlist.
- Optimized the script's performance by cleaning up raw text inputs (removing hidden spacing) and forcing an immediate exit the moment the correct key is found.

HomeLab Security

[github.com/homelab](https://github.com/pranshu030803/homelab)

- Repurposed an old enterprise-grade machine into a dedicated Linux security server to host centralized network monitoring and defense tools.
- Set up Pi-hole to handle DNS-level blocking, successfully cutting off malicious ad networks, trackers, and potential threat vectors across the entire home network.
- Configured host-based firewall rules using UFW to restrict inbound and outbound traffic, and published the sanitized configuration logs to GitHub.

Network Traffic Analysis Lab

[github.com/networkAnalysis](https://github.com/pranshu030803/networkAnalysis)

- Set up a secure network monitoring lab on an Ubuntu environment to safely capture, isolate, and inspect live packet data.
- Used Wireshark to intercept active connections, analyzing protocol headers and tracking packet lifecycles to spot unusual network behavior.
- Created custom display filters and search rules using logical statements to quickly pinpoint specific network threats and indicators of compromise.

Experience

Junior Software Engineer Intern, STACKLAB – Pune, India

Sept 2023 – Nov 2023

- Developed and integrated modular software components for active company projects, focusing on clean code structure and maintainability.
- Conducted systematic project testing and debugging to identify logic flaws, code errors, and operational vulnerabilities before deployment.
- Collaborated closely with the development team to review project requirements and ensure high-quality software delivery

Education

Vellore Institute of Technology – B.Tech in Computer Science with Information Security

2025

Google – Google Cybersecurity Professional

2026

CompTIA – Security+

ongoing

Microsoft – SC300

ongoing
